

Subfloor Ventilation System Benefits for the Southern Highlands and Central Coast

Subfloor ventilation will benefit those who are experiencing problems in the Southern Highlands and Central Coast. These two areas share similar land contouring. There is a mix of flat land whereby water cannot drain away, to sloping hills whereby moisture travels down hill to dwellings and become entrapped in the subfloor area. This can cause problems inside the dwelling eg-musty smells, degenerate healthy air quality, an attraction to termites, breeding ground for mould and mildew.

Envirofan subfloor ventilation systems can tackle these issues for those residences on the Central Coast and Southern Highlands and these issues are not difficult to reverse. Moisture issues firstly must look at the source. Where is the moisture coming from? On a sloping block moisture will travel from the upper regions. So what should be considered is subsoil or agricultural drainage. This will avert the majority of moisture from getting into the subfloor area. On flat land this tends to be more difficult to pinpoint. Subsoil drainage should still be implemented. This alone will not be the end to the problem as Envirofan subfloor ventilation systems with its integral low voltage fan system will physically draw the moist air out. These are usually located where the musty smell seems to be the most pronounced. By its airflow of 2,750 – 5,500 litres per minute being extracted from the dwelling in a whisper quiet operation, it is obvious that the same amount of air will be induced from the outside.

Why does Envirofan have the edge on other products? The testing process was very critical before the product entered the market place in the 1970's. Other ventilation systems don't have this credential.

Other subfloor ventilation systems usually only have one fan. If this should cease working then 100% of the ventilation properties are lost until such time as the ventilation systems is repaired or replaced. With regard to the Envirofan subfloor ventilation system in the case of the quad fan system, if one of the impeller ceases to function then only 25% of subfloor ventilation properties are lost.

Envirofan quality in product and effectiveness can bring many benefits to those of the Southern Highlands and Central Coast regions.

Envirofan subfloor ventilation systems - Brisbane, Gold Coast, Taree, Newcastle, Central Coast, Sydney, Southern Highlands, Illawarra, South Coast, Melbourne and Adelaide.
